

Remote Backup & Recovery

Dependable Backup

In today's digital world, the loss of your valuable corporate data would be devastating. Yet despite the risk, many companies rely on antiquated backup methods, or worse—they simply leave data loss to chance.

Traditional tape backup systems are unreliable, cumbersome and require regular manual administration. With remote backup and recovery from LOCKNET, your information is automatically written to secure digital vaults at multiple offsite data centers. Your data never touches tape—ever.

In the event that you lose data and need to retrieve it, all your information can be easily recovered over the web. And if you need assistance, the expert LOCKNET team is ready to assist.

The Right Solution

- Offsite backups protect your information from fires, floods, and physical theft—you can't get the same assurance with onsite solutions.
- Redundant digital storage provides ultimate security. Meanwhile, over half of all tape backups fail.
- Digital storage means recovery is instant and easy. Tape recovery is both tedious and expensive.
- Remote backups are automated, so data security is never neglected or forgotten.
- Remote backups meet regulatory guidelines, and the LOCKNET system supports custom archiving policies.

RealLifeStories

NOT CHILD'S PLAY

IT Challenge:

Customer data is vital to any organization, including nonprofits like the Children's Museum of La Crosse. The museum needed to find an efficient and cost effective solution that would protect member and donor information in case of a disaster. In addition to data backup, the museum needed a solution that would provide turnkey data recovery as they did not have any staff members with true IT background and could not afford prolonged downtime.

LOCKNET IT Solution:

LOCKNET worked with the museum to determine which files and applications were most critical to ongoing operations. This data was then protected by LOCKNET's Remote Backup and Recovery service. LOCKNET backs up data, via a secure VPN connection, to redundant data vaults. Each month museum staff receive executive summary reports that clearly outline the type of data backed up and storage space consumed. The real benefit, however, is peace of mind. No matter what, the museum's important information is safe, and a team of experts is on call, ready to get them back up and running if a disaster occurs.

Enterprise Support

Secure 256 bit AES data encryption during transmission and storage

One appliance manages multiple servers, platforms

Second data center on separate power grid

Keep a local copy for direct recovery

Backup multiple locations and remote users

Easy and Secure

- Automated, secure off-site backups – no more tape or hassles
- Installation and support from a team of experts
- Completely eliminate unreliable tape backup
- Only pay for what you use
- 24x7x365 secure access to your data via the internet
- Backup and recovery for LAN, WAN & remote workers
- Compliant with HIPAA, Sarbanes-Oxley & GLBA
- No hardware or software to purchase or manage
- No staff time required for management or training
- Data compression and de-duplication ensure fast backup and recovery
- Full reporting and alerts
- Support for nearly all platforms and applications
- File restoration available to a single document or email
- Data resides on secure vaults in redundant data centers
- Data is 256-bit AES encrypted in-flight and at-rest for true security
